Blomberg L.A., Chan W.-Y., Clerch L., Massaro D.;
regulated genes in rat lung.";
Submitted (SEP-2000) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: May play a role in intercellular matrix. May take part in connecting caid.

-!- FUNCTION: May play a role in intercellular matrix. May take part in the regulation of cell motility, growth and differentiation. Binds hyaluronic acid.

-!- SUBCELULAR LOCATION: Secreted; extracellular matrix.

-!- ALTERNATIVE PRODUCTS:

SIMILARITY: Contains 1 Sushi (SCR) domain.

SIMILARITY: BELONGS TO THE AGGRECAN/VERSICAN PROTEOGLYCAN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isold=09ERB4-3; Sequence=VSP 001092;
TISSUE SPECIFICITY: In kidney is expressed in the papillary area, but not in glomeruli.
DEVELOPMENTAL STAGE: Disappears after the cartilage development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Glycoprotein; Proteoglycan; Lectin; Extracellular matrix; Sushi;

-1 TISSUB SPECIFICITY: V2 is found only in brain.
-1 DEVELOPMENTAL STAGE: Disappears after the cartilage development.
-1 SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
-1 SIMILARITY: Contains 2 EGF-like domains.
-1 SIMILARITY: Contains 1 Cetype lectin family domain.
-1 SIMILARITY: Contains 1 Cetype lectin family domain.
-1 SIMILARITY: Contains 1 Sushi (SCR) domain.
-1 SIMILARITY: BELONGS TO THE AGGRECAN/VERSICAN PROTEOGLYCAN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               EGF-LIKE 1.

"Differential expression of versican isoforms in brain tumors.";
J. Neuropathol. Exp. Neurol. 55:528-533 (1996).
-!- FUNCTION: May play a role in intercellular signaling and in connecting cells with the extracellular matrix. May take part in the regulation of cell motility, growth and differentiation. Binds hyaluronic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isold=Pi3611-5; Sequence=VSP 003086;
TISSUE SPECIFICITY: Cerebral white matter. V0 and V1 is expressed in normal brain, gliomas, medulloblastomas, schwannomas, neurofibromas, and menningiomas; v2 is restricted to normal brain and gliomas; v3 is found in all these tissues except medulloblastomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        --- DEVELOPMENTAL STAGE: Disappears after the cartilage development.

```

ISOId=P13608-2; Sequence=VSP 003072;
DOMAIN: TWO GLOBULAR DOMAINS, GI AND G2, COMPRISE THE AMINO
TERMINUS OF THE PROTEOGLYCAN, WHILE ANOTHER GLOBULAR REGION, G3,
MAKES UP THE C-TERMINUS. GI CONTAINS LINK DOMAINS AND THUS
CONSISTS OF THREE DISGLETIDE-BONDED LOOP STRUCTURES DESIGNATED AS
THE A, B, B' MOTIFS. G2 IS SIMILAR TO G1. THE KERATAN SULFATE (KS)
AND THE CHONDROITIN SULFATE (CS) ATTACHMENT DOMAINS LIE BETWEEN G2

Event=Alternative splicing; Named isoforms=2;

Isold=P13608-1; Sequence=Displayed;

PTM: CONTAINS MOSTLY CHONDROITIN SULFATE, BUT ALSO N-LINKED AND O-

AND G3

+

LINKED (ABOUT 40) OLIGOSACCHARIDES.
PTM: THE KERATAN SULFATE CONTENTS DIFFER CONSIDERABLY BETWEEN
ADULT AND FETAL BOVINE PROTEOGLYCANS.

 ISOId=P16112-3; Sequence=VSP 003074, VSP 003075; DOMAIN: TWO GLOBULAR DOMAINS, GI AND G2, COMPRISE THE AMINO TERMINUS OF THE PROTROCINCAN, WHILE ANOTHER GLOBULAR REGION, G3, MAKES UP THE COOH TERMINUS. GI CONTAINS LINK DOMAINS AND THUS CONSISTS OF THREE DISULPIDE BONDED LOOP STRUCTURES DESIGNATED AS THE A, B, B, MOTIFS. GI IS SIMILAR TO G1. THE KERAPAN SULFATE (KS) AND THE CHONDROITIN SULFATE (CS) ATTACHMENT DOMAINS LIE BETWEEN G2
 -I- FUNCTION: THIS PROTEOGLYCAN IS A MAJOR COMPONENT OF EXTRACELLULAR MATRIX OF CARTILAGENOUS TISSUES. A MAJOR FUNCTION OF THIS PROTEIN IS TO RESIST COMPRESSION IN CARTILAGE. IT BINDS AVIDLY TO HYALIONIC ACID VIA AN AMINO-TERMINAL GLOBULAR REGION.
-I- SUBUNIT: Interacts with FBLNI (By similarity).
-I- SUBCELLULAR LOCATION: Secreted; extracellular matrix (By
 -!- PTM: CONTAINS MOSTLY CHONDROITIN SULFATE, BUT ALSO KERATAN SULFATE
 CHAINS, N-LINKED AND O-LINKED OLIGOSACCHARIDES.
--- SIMILARITY: Contains 1 immunoglobuln-like V-type domain.
--- SIMILARITY: Contains 4 link domains.
--- SIMILARITY: Contains 1 EGF-like domain.
--- SIMILARITY: Contains 1 C-type lectin family domain.
--- SIMILARITY: Contains 1 C-type lectin family domain.
--- SIMILARITY: Contains 1 Sushi (SCR) domain.
--- SIMILARITY: BELONGS TO THE AGGRECAN/VERSICAN PROTEOGLYCAN FAMILY.

AND THE CHONDROITIN SULFATE (CS) ATTACHMENT DOMAINS LIE BETWEEN G2 AND G3.

-!- PTM: CONTAINS MOSTLY CHONDROITIN SULFATE, BUT ALSO KERATAN SULFATE CHAINS, N-LINKED AND O-LINKED OLIGOSACCHARIDES (BY SIMILARITY).
-!- SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
-!- SIMILARITY: Contains 1 C-type lectin family domain.
-!- SIMILARITY: Contains 1 C-type lectin family domain.
-!- SIMILARITY: Contains 1 Sushi (SCR) domain.
-!- SIMILARITY: Contains 1 Sushi (SCR) domain.
-!- SIMILARITY: Contains 1 EGF-like domain.
